

SMS API

CREATE FAST AND EFFICIENT COMMUNICATION VIA TEXT MESSAGES

Use texts when the order is in, the package is outside the door or to communicate a message with multiple people simultaneously.

WHY USE TEXTS?

Text messages have a higher reading frequency than the equivalent communications via email or direct mail. Integrate our SMS API into your business systems to handle large amounts of texts every day. It's fast, easy and cheaper than sending letters.

SELECT ONE OR MORE RECIPIENTS

Our text message portal can send messages to one or several recipients. For example, with text to a specific person, you can confirm an order or notify a delivery. Want to reach out with fast information to a larger group, you can easily send a text to multiple recipients at the same time.

THE RIGHT TEXT AT THE RIGHT TIME

You can choose whether you want to send the message directly or schedule it for later, such as a reminder that expires 30 minutes before the scheduled time. The information becomes mobile and can therefore be easily picked up when and where it is needed. Something that is especially beneficial for example with discount codes or visitor information.

CUSTOMIZE WITH API

Customize the flow to suit your requirements, you can also combine the API with your surrounding systems to tailor the experience. Manage notifications, information feeds, orders, changes and additions directly through the customer's mobile. Since you choose how to implement the SMS API, you can use it to send everything from a single text to posting all orders in your company.

USE CASES

Notifications: Send reminders and notifications for appointments, bookings, deliveries and more with the SMS API.

Promotions: Send marketing messages and offers with the SMS API to leads, for sales, and loyalty.

Verifications: Deliver one-time passwords with the SMS API for fast onboarding and to reduce support costs and fraud.
